

MEMBRA® Membrane

Self-adhesive membrane system for wet rooms

Description :

The membrane fabric consists of PE foam with an upper surface of PP felt. The entire back is coated with adhesive protected with silicone-treated foil. The foil is divided in two for easy and safe installation. The membrane fabric is waterproof and diffusion-impermeable, and together with other system components provides a complete membrane solution.

Application :

The Membra wet room system is used as a waterproof membrane for walls and floors in wet rooms. The membrane is installed as a base for tiles or other types of floor or wall cladding. The system can be used on solid, moisture-stable substrates such as concrete, screed, wet-room panels, plasterboard, old tiles and wood wool boards that are approved for wet rooms. For details see SINTEF TG 20611.

Storage :

Dry and protected from UV

Approvals and guarantee

Installation :

The membrane fabric is installed in complete lengths on floors and walls. The substrate must be firm, clean, dry and free from grease. Absorbent substrates, gaskets and details in wet zones must always be primed first with Membra Adhesive Primer. [See installation steps.](#)

For more details see laying instruction on our website.
